**INTENDED USE**
The Proflow™ Enterovirus test is a single use rapid membrane immunoassay for the qualitative detection of Enterovirus antigen (VP1 peptide) in faeces samples to aid in the diagnosis of Enterovirus infection. For In Vitro Diagnostic Use.

**SUMMARY AND EXPLANATION**
Enteroviruses consist of Poliovirus, Coxsackievirus, Echovirus, and numbered enteroviruses. Enteroviruses are single-stranded RNA viruses and can cause a wide spectrum of diseases in humans. All enteroviruses are transmitted by the faecal oral route but clinical outcomes may go beyond gastrointestinal as some viruses travel from the intestinal tract to other organs. Poliovirus usually infects its host by attacking the central nervous system and causing paralysis in victims (poliomyelitis). Coxsackievirus has been associated with not only respiratory system infections and gastrointestinal but also insulin-dependent diabetes and heart diseases such as myocarditis and pericarditis. Echovirus is generally less infectious than other enteroviruses and is usually associated with the common cold and respiratory diseases. The numbered enteroviruses (Enterovirus types 68 to 71) have not been studied extensively but have been isolated from patients with bronchiolitis, conjunctivitis, meningitis, and paralytic resembling poliomyelitis.

**PRINCIPLE OF THE TEST**
The Proflow™ Enterovirus test is a single use rapid membrane immunoassay for the qualitative detection of Enterovirus antigen in human faecal samples.

Monoclonal antibodies to Enterovirus antigen are coated onto the test line region of the strip. During testing the sample migrates along the membrane by capillary action and is allowed to react with the conjugate on the test strip. In the case of a positive result the specific antibodies present on the membrane will capture the coloured conjugate.

A green line should always appear in the control line region to show that sufficient volume was added, proper flow was obtained and the reagents functioned correctly. Failure of the control line to appear, whether or not test lines are present, indicates an invalid assay.

The test is interpreted by the presence or absence of visibly detectable coloured lines in the test region at 10 minutes or less depending on the concentration of antigen present. A positive test result will show a pink/red test line and a green control line, indicating that Enterovirus antigen is present in the sample. A negative test result, read at 10 minutes, will show only a green control line, indicating that Enterovirus antigen was not detectable in the sample.

**STABILITY AND STORAGE**
- Store all components at 2°C to 8°C.
- Do not freeze or overheat.
- Do not use beyond the expiration date printed on the outer package label.
- The test kits should be kept away from direct sunlight, moisture and heat.

**PRECAUTIONS**
- For In Vitro Diagnostic Use only.
- For professional use only.
- Directions should be read and followed carefully.
- Tests are for single use only. Do not reuse.
- Reagents are provided at the necessary working strength. Do not dilute reagents.
- Do not interchange reagents between kits with different lot numbers.
- Do not use kits or reagents beyond the stated expiration dates.
- Microbial contamination of reagents may decrease the accuracy of the assay.
- Treat all materials as if they were infectious and dispose of all material in accordance with local regulation.

**MATERIALS PROVIDED**
- PL.3113 Proflow™ Enterovirus Test Devices: 20 devices
- PL.3213 Proflow™ Enterovirus Sample Preparation Device: 20 devices
- Package insert

**MATERIALS REQUIRED BUT NOT PROVIDED**
- Sample collection container
- Timer or stopwatch
- Biohazard disposal container
- Disposable gloves

**SAMPLE STORAGE AND COLLECTION**
- Collect sufficient quantity of faeces (162g or 162mL for liquid samples)
- Faecal samples should be collected in clean and dry containers (no preservatives or transport media).
- Samples may be stored at 2°C to 8°C for 162 days or at 20°C for longer periods before testing.
- Allow all samples to equilibrate to room temperature before testing.
- Freezing and thawing cycles are not recommended.

**TEST PROCEDURE**
Use a separate sample collection vial and test for each sample or control. Allow the tests, test devices and buffer to reach room temperature prior to testing.

1. Introduce the swab or stick two or three times into the faecal sample to pick up approx. 125 mg and put back into the sample preparation device with buffer.
2. Shake the sample preparation device to ensure good sample dispersion.
3. Remove the Proflow™ Enterovirus test from its sealed pouch.
4. Break off the top of the vial on the sample preparation device.
5. Dispense 4 drops into the sample well on the test (S).
6. Read the result at 10 minutes.

**QUALITY CONTROL PROCEDURE**
It is recommended that a positive and negative control be used to ensure that the test is performing as expected. The control line (C) is a procedural control and will show that the test has been performed correctly; proper flow occurred and the test reagents functioned as expected. When a green line appears at the control line position this indicates the test has been performed correctly. The control line will appear on all valid tests, whether or not the sample is reactive or non-reactive (refer to the Interpretation of Results section).

**INTERPRETATION OF RESULTS**

- **Positive**
  - A pink/red line of any intensity appears in the test window at the test line position. This indicates a reactive result that is interpreted as positive for Enterovirus antigen.

- **Negative**
  - A single green line of any intensity appears in the test window at the control line position. There is no line at the test line position. This indicates a non-reactive result that is interpreted as negative for Enterovirus antigen.

- **Invalid**
  - No line appears in the test window at the control line position. This is an invalid result and cannot be interpreted. This is irrespective of whether or not a pink/red line appears in the test window at the test line position. If either condition below occurs, the test should be repeated with a new test.

**REFERENCES**

Poliovirus usually infects the host by attacking the central nervous system and causing paralysis in victims (poliomyelitis). Coxsackievirus has been associated with not only respiratory system infections and gastrointestinal but also insulin-dependent diabetes and heart diseases such as myocarditis and pericarditis. Echovirus is generally less infectious than other enteroviruses and is usually associated with the common cold and respiratory diseases. The numbered enteroviruses (Enterovirus types 68 to 71) have not been studied extensively but have been isolated from patients with bronchiolitis, conjunctivitis, meningitis, and paralytic resembling poliomyelitis.
LIMITATIONS OF THE PROCEDURE
1. The test must be carried out within 2 hours of opening the sealed bag.
2. An excess of faecal sample could cause wrong results (brown bands appear).
   Dilute the sample with the buffer and repeat the test.
3. After one month of infection the number of viruses in the faeces decreases making
   the sample less reactive. Faecal samples may be collected prior to the onset of
   symptoms or 24-48 hours after the onset of symptoms.
4. This test provides a presumptive diagnosis for Enterovirus group infections.
5. If the test result is negative and clinical symptoms persist, additional testing using
   other clinical methods is recommended. A negative result does not at any time preclude the possibility of Enterovirus infection.
6. If the patient has been recently vaccinated (for example against Poliovirus), it could
   appear as a positive result.

PERFORMANCE CHARACTERISTICS
SENSITIVITY AND SPECIFICITY
An evaluation was conducted comparing the results obtained using the Proflow™
Enterovirus test with immunofluorescence.

Proflow™ Enterovirus test showed:
Specificity >99%
Sensitivity >99%

CROSS-REACTIVITY
An evaluation was performed to determine the cross-reactivity of the Proflow™
Enterovirus test. There is no cross-reactivity with common intestinal pathogens or other
organisms and substances occasionally present in faeces:
- Astrovirus
- Rotavirus
- Giardia lamblia
- Clostridium difficile
- Shigella
- Listeria monocytogenes
- Entamoeba hystolitica
- Staphylococcus aureus
- Norovirus
